"Thymectomy in the Treatment of Myasthenia Gravis."

Belgrade, Srpski Arhiv za Celokupno Lekarstvo, Vol 91, No 3, Mar 63; pp 237-249.

Abstract [English summary modified]: Very thorough clinical data on 4 women with myasthenia gravis; aged 16 to 23: 1 had thymus persistens, 2 incompletely involuted thymus. Definite improvement in all 4 after excision of thymus tissue; 2 years postoperatively 1 had died from intercurrent influenza, the other 3 are all better than preoperative. Early thymectomy is recommended in this disease. Photomicrograph; 3 specimen photographs; 3 tables; 2 Yugoslav and 16 Western references.

Title : Salinity of Soils in the Alluvial Belt of Neretvansko Blatiyo

Orig Pub : Biljna proizv., 1957, 10, No 1, 31-45

Abstract : By the name Neretvansko Blatiyo is understood the belt of alluvials, often of stagnant accretions, in the Neretva river valley (Herzegovina, Yugoslavia) from the Chaplin mountains to the fall of the river into the Adriatic Sea. Almost 2/3 of the area of the soils of this belt are not reclaimed from frequent high floods and swamping. A Mediterranean climate prevails, with a mean annual temperature of 15.5° , and a total precipitation of 1100 mm, which falls in the cold time of year, and with dryness in the

The effect of glucose and hydergin level on clotting time in man. M. Vidopliac and N. Jelavic (Med. School, Zagreb, Yugoslavia). *Acta Haematologica* 23: 73 (1960). Ingestion of glucose (I) reduced coagulation time in a degree related to the initial clotting time and existing tendencies to fast or slow coagulation. A rise in I concn. *in vitro* corresponding to that following its ingestion did not alter the plasma prothrombin and thrombin times. Parenteral administration of the hydrogenated ergot alkaloids dihydroergocornine, dihydroergocristine, and dihydroergokryptine inhibited the hyperglycemia following I ingestion, but did not prevent the decrease in clotting time. Parenteral administration of hydergin alone reduced clotting time which persisted up to 8^{1/2} hrs. Ruth B. Pitt

AUTHOR: Jelenek, Antonin

TITLE: A device producing oscillating motions

PERIODICAL: Referativnyy zhurnal, Tekhnologiya mashinostroyeniya, no. 1, 1963,
63 - 64, abstract 1B358P (Czechosl. patent cl. 48 b, 2, no. 99748,
of May 15, 1961)

TEXT: A patent is delivered for a pneumatic vibration device for shaking parts (to remove the electrolyte). The parts are fixed on a suspension device after they have been taken out of the bath, e.g. after tinning. The vibration device has a cylinder inside of which a piston moves; the piston is fixed on the shaft top (the part is suspended at the bottom). In the upper and lower portion of the cylinder there are holes for letting out and in compressed air. In the piston an aperture serves to transfer the compressed air from underneath the piston to the upper cylinder portion (over the piston). A blank disk acts as a slide valve; it is located below the piston and moves freely along the shaft. During the upward motion of the piston the disk is pressed by the air pressure to the lower

cylinder edge and closes the by-pass aperture. When the piston approaches the top cover of the cylinder, special squeezing pins of the disk butt against the cover (the pins pass through the piston and protrude outside the top) the disk is pressed off the piston, the by-pass aperture is opened, the air passes into the upper cylinder section, and is let out. Subsequently the piston and the blank disk descend under the load of the suspended part; in the lower section of the cylinder the piston lies tightly upon the disk; as a result the by-pass aperture is closed and the cycle is repeated.

Jelenic, Dardé B.

✓ Effect of calcium cyanamide and calcium ammonium nitrate on yield and quality of sugar beets. Dardé B. Jelenic und Života Popović (Univ. Belgrade, Zemun, Jugoslavia). *Zemljiste i Biljka* 1, 61-01 (1952) (English summary). —CaCN₂ (I) and Ca-NH₄ nitrate (II), i.e. NH₄NO₃ + CaCO₃, were used on various kinds of Chernozem soils for the fertilizing of sugar beets; the soils received in addition sufficient P as superphosphate and sufficient K as 40% KCl. The dose of N of either I or II was 30, 60, 90, 120, or 150 kg./ha., and all expts. were repeated 5 times. The results are not too easily interpreted, as the meteorological conditions have a large influence on the beet yield and qualities. However, these large-scale expts. showed beyond any doubt, that N, if added as II, shows better effect than if added as I. *Wetzel* is absent.

Jelenic, Darde B

New potassium-fertilizer "Liskal" and potassium-phosphorus fertilizer "Liskaphos." Stevin Nikolaj Jelenic, and Franjo Rijavec (Poljoprivredni Fakultet, Zemun, Yugoslavia). Zenitiste i Bilje 2, 417-80 (1951). Liskal was prep'd. by heating a muscovite ($H_2KAl_3Si_3O_{10}$) at 900° in the presence of $CaCO_3$, and grinding it to a fine powder. It contained 4.4% water-sol. K_2O . To increase the fertilizing value of Liskal, the same muscovite was treated with a Dalmatian phosphorite, and a binary K and P product "Liskaphos" obtained, contg. acid-sol. P_2O_5 10.95-13.05, and water-sol. K_2O 4.58-5.23%. The strong fertilizing action of both Liskal and Liskaphos was proved by numerous tests on oats planted in chernozem and podzol. The application of Liskal in pots and in field brought an increase in yield of oats comparable to that obtained by the application of conc. K salts, contg. 40% K_2O . Liskaphos was applied only in pots and its fertilizing action was found to be comparable to that obtained by applying a mixture of superphosphates with K salts contg. 40% K_2O . S. I.

TITLE: Methods for improving some of the properties of concrete-II

PERIODICAL: Referativnyj zhurnal. Khimiya, no. 4, 1962, 395, abstract 4K372 (Zašt. mater., v. 8, no. 10, 1960, 423-426)

TEXT: Concrete is protected from corrosion and mechanical damage by chemical treatment of its surface or by the application of coatings. The following are examined: fluorination by the fluorosilicates of magnesium, zinc, aluminum and lead; chemical hardening with sodium silicate; gas treatment with silicon fluoride; oxalic acid treatment (oxalation). The following are cited as examples of mechanical protection: surface application of bituminous mixtures; treatment with plastic compositions based on polyvinyl acetate emulsions, or copolymers of fluorodivinyl; application of mixtures of cement with rubber latex. Some substances are given which are used for the production of hydrophobic cements. For information on I see RZhKhim. 1961, abstract 18K330. [Abstracter's note: Complete translation.]
